3. Introduction / Overview

The game focuses on immersing the player in the world by deciding the car´s route, connecting with your passengers and having an impact on their lives.

3.1. Overview

The game is a first-person interactive game, where you will be a taxi driver. The setting of the universe is an alternative modern age, a darker and a bit more brutal version of our world.
The main point of the game is interacting with your clients and being able to make an impact on their lives, through dialogue choices. Nevertheless, the way you perform in your shift will influence your taxi driver's reputation and the feedback from the clients will change.
The players' choice of words directly impacts the clients life's, and may lead to the world healing, or getting ruined even more.
The user will be able to interact with the car features such as radio, lights and phone among others. The game will use detailed pixel art layered on 3D simple object.

The target audience is gamers that enjoy story-based, choice making games.

It´s a choice driven narrative adventure.

4. Game Concept

The gameplay combines driving through a city while the passenger converse with you. You will have to choose where to go in bifurcations and the answer you give to your passengers. The player can interact with the car (radio, gps, and more)

Some unique selling point can be: An emotion tracking system that will affect the gameplay and ending, combining skills through driving and the narrative story.

Our main inspirations are games such as “The red strings club” and “Va11-hall-A”.

5. Gameplay and Controls

The player can move the camera with the mouse. To interact with objects, press ‘E’. To choose which path to go the player will select between the keys ‘A’ and ‘D’.

The player will drive as he interacts with the world through fidgeting with the radio or set the mood for the NPCs. It´s possible that the player will have more than one quicktime event at the same time.

To set the mood, the player needs to adjust the lights inside the car. The player will be able to choose between three colours: blue, red and green; Each colour choice is called blip, once ten blips have filled the bar the output will decide how the passenger will be feeling inside the car. It will all depend on which colour is more prominent.

The gameplay loop consists of: receive a passenger -> have a conversation with them -> choose the driving path -> take them to their destination -> repeat.

Your choices will register points, depending on the amount of points the atmosphere will be different (angry, happy, sad, calm).

6. Game World, Levels, and Environments

The progression is focused on how you act towards your passengers. Depending on the routes you took and the answers you gave you will receive different endings.

6.3. Progression, Items, and Rewards

Progression and reward are represented via “Mood points”, depending on the ambience you create. And passengers will rate you after their trip through the taxi app.

7. Story and Narrative

7.1. Story

In the underworld you work as a lost soul who helps other souls find their path. You will learn about them as you drive them through buildings that will bring up different memories, listen to their stories and give them your thoughts. In their last journey they may leave as a recovered soul or an angry entity.

7.2. Characters

The main character is the player who is a taxi driver that won´t have any notorious physical attribute as it´s set to represent both any player and an anonymous soul. Through progression the player will figure out the answer to questions regarding lore such as to why we are a taxi driver to souls, why our answers matter.

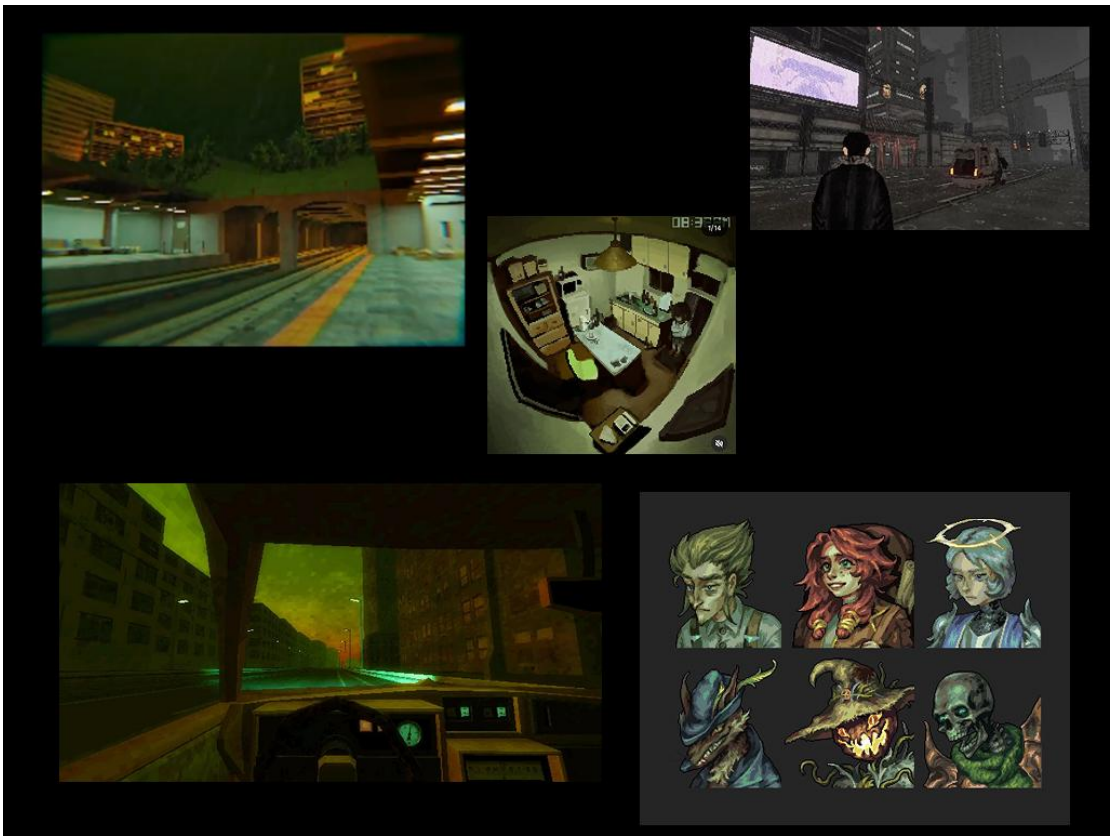

NPCs will have their own backstories that the player will discover as the game progresses, the player may encounter the same NPC more than once.

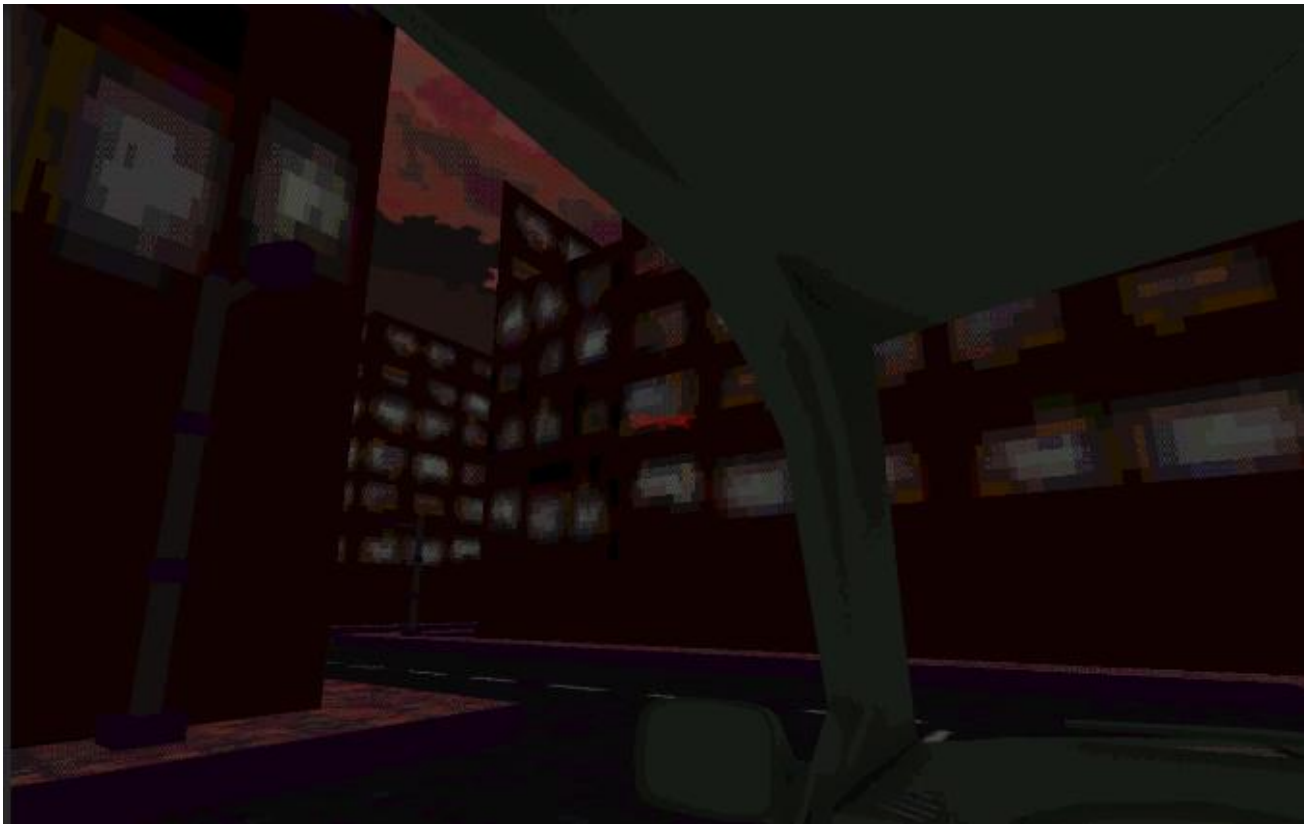

7.3. Methods for aesthetics

Immersion created through the atmosphere of the world. The taxi will display a light glowing constantly, it will reflect the mood of the passenger as it will change depending on your answers. Blue for sad, red for angry, yellow for neutral and green for happy.

8. Art and Assets

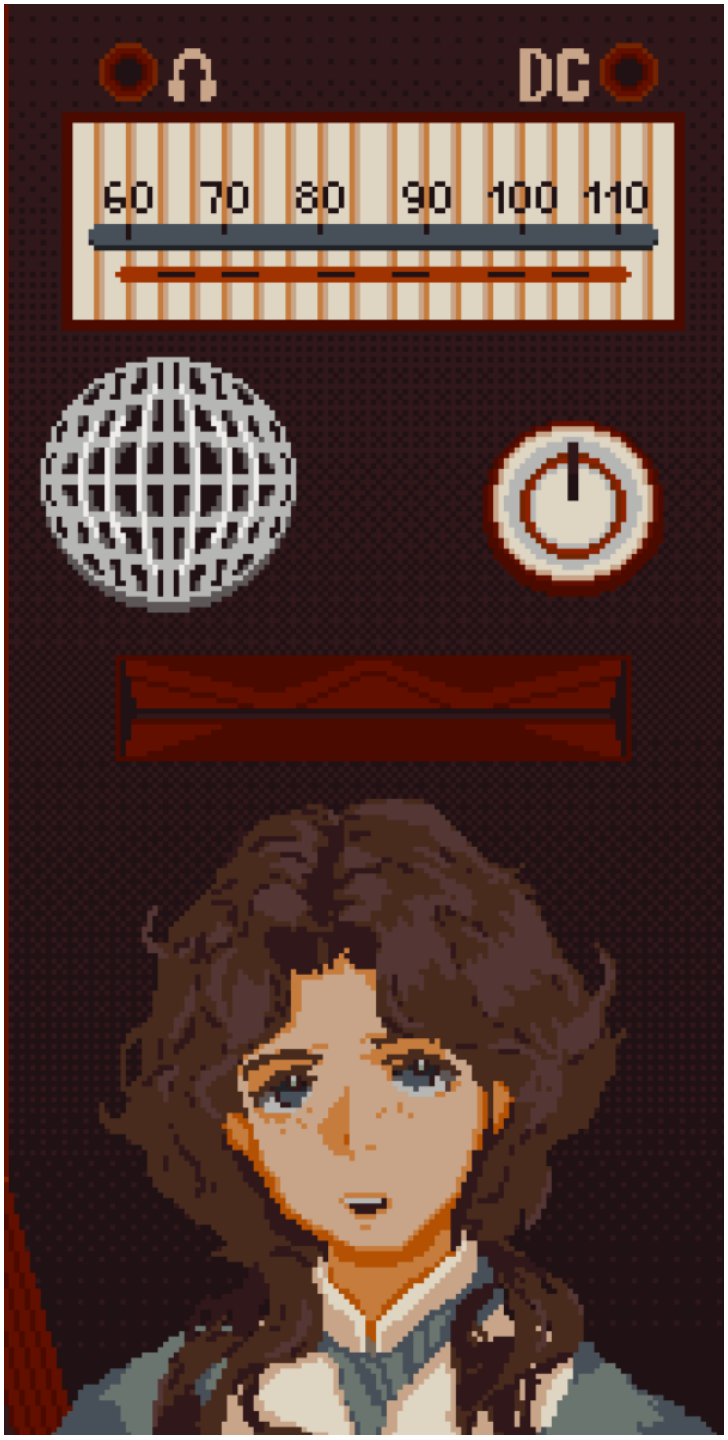

The game will be a 2.5D with pixel art.

9. User Interface (UI) and User Experience (UX)

Interactable objects include: Radio, car lights, gps, phone and cigarettes. There is an interactive panel on the right side of the screen where the player can check the song choices by adjusting the radio station, and adjust the lights to create the ambience the passenger needs in that moment; The phone can be used when there is no passenger; To save your game the player will interact with the cigarettes.

10. Audio Design

There will be background music for ambiance, combined with the radio programs/songs to add to the atmosphere. Characters won´t have voices for now, in the future they may emit sounds.

11. Monetization

At this point the game is set to be free to play as it´s a graduation project. No monetization plan has been made yet.

12. Multiplayer Features

The game is strictly single game, there won´t be a multiplayer option as it´s a story based game meant for one player.

13. Testing and Quality Assurance

Game testing will take place among our university peers and friends. Sending a survey every time we do a play test to receive feedback on bugs, improvements and general thoughts.

14. Marketing and Promotion

For marketing purposes, the project will be advertised via posters in G-Star and in university. Possibility of updating it to a digital platform is being considered.

15. Budget and Resources

The estimated cost of the project is set to 0 as there weren´t necessary any assets.

16. Schedule

A 9-month schedule is set for the project, with deadlines among the members and progression almost weekly. With meetings and communication always present with the team members.

This is an orientative schedule, a more detailed one can be found in our Trello

	ZLATA	**IRENE**	**DANIEL**
AUGUST	Main menu	GPS system	Map
SEPTEMBER	Main canvas	Road triggers	Characters sprites
OCTOBER	Dialogue system	Interaction with objects	Interactive panel sprites
NOVEMBER	G-STAR SHOWCASE		
DECEMBER	Debugging	Polish gameplay	Create more characters
MARCH	Adding more characters	Adding path choosing option	Create music
APRIL	Expected feedback from beta-testers and modifying the game from their insight		
MAY	Last changes of the game and expected final version to be ready		
JUNE	THESIS DEFENSE
